

NECROTIZING SIALOMETAPLASIA :A LESION OF CONCERN . REVIEW OF LITERATURE AND REPORT OF CASES

.THE NEW EGYPTIAN JOURNAL OF MEDICINE , 9 :691-693 , 1993.

التحويل الخلوى الإنشعاقى التقرحى للغدد اللعابية ، مرض يستدعى الإهتمام ، دراسة للمراجع العلمية وتسجيل عدة حالات .

ABSTRACT :

A new lesion of concern with startling clinical appearance . It is characterized mainly by punched out , sharply demarcated , craterous ulcer .The ulcer is almost covered with necrotic tissue and is not painful , bearing a very strong resemblance to squamous cell carcinoma . Histologically , the lesion mimic also carcinoma .However , the lesion is benign and self-healing .Healing is generally slow , requiring up to 8 weeks for complete resolution
